## Abstract

It is generally argued that the permanent or fixed portion of total current assets should be financed by long term sources and the temporary or variable portion of the total current assets should be financed by short term sources. However, in the real world situation this argument does not always holds good. The pattern of financing current assets adopted by a firm depends upon several factors, such as cost of capital, risk performance of owners etc. several studies on this issue have been made in India and abroad but no significant study on Indian public sector oil and gas companies considering the matter addressed here has been carried out. Oil and gas companies have a significant place in our national economy as it provides the basic input to infrastructure and consumer goods. In this backdrop, the present study seeks to examine financing pattern of working capital of select public sector oil and gas companies during the period 1978-79 to 2015-16. The present study has been made by simple mathematical analysis of collected secondary data.

## I. Introduction

WORKING CAPITAL IS the amount of funds which an enterprise has to use to finance its day-to-day working on operations. It can also be regarded as that portion of the firm's total capital which is employed in current assets. It is generally argued that the permanent or fixed portion of the total current assets should be financed by long term sources and the temporary or variable portion of the total current assets should be financed by short-term sources. However, in the real world situation this argument does not always hold good. The pattern of financing current assets adopted by a firm depends upon several factors, such as cost of capital, risk preference of the owners, demand and supply position in the money market etc.
